Track 2 · Health and Wellbeing

BridgeCare

An AI that knows when to stop

Discharge documents turned into clear patient sheets, in English or Spanish. Every value cites its source; only a person approves.

AMD Developer Hackathon ACT III · October 2026

Who uses BridgeCare

Discharge nurse or discharge coordinator

Turns a dense clinical discharge document into instructions a patient can follow at home.

Every discharge sheet has to answer

- Which medicines
- How much
- How often
- For how long
- When to come back
- Which symptoms mean danger

02 · THE PROBLEM

Discharge instructions are written in a hurry

Dense documents

Long clinical text to read under pressure

Time pressure

Discharge sheets are written in a hurry

Miscopied doses

One wrong digit can harm a patient

Contradictions

Two parts of a document disagree

Language barriers

Patients may not read the document's language

Occupied beds

In emergency departments, paperwork keeps beds occupied

OUR ANSWER

An AI that knows when to stop

BridgeCare drafts the patient sheet, proves where every value came from, and hands the final decision to a person.

03 · HOW IT WORKS

From document to patient sheet

01

Source

Care team

Original document, never modified

02

AI draft

Model on AMD

Every field with an exact citation

03

Verify

BridgeCare

Quotes and doses checked verbatim

04

Gate

BridgeCare

Blocks unsafe or conflicting output

05

Review

Human reviewer

Approves one exact, hashed revision

06

Patient sheet

BridgeCare

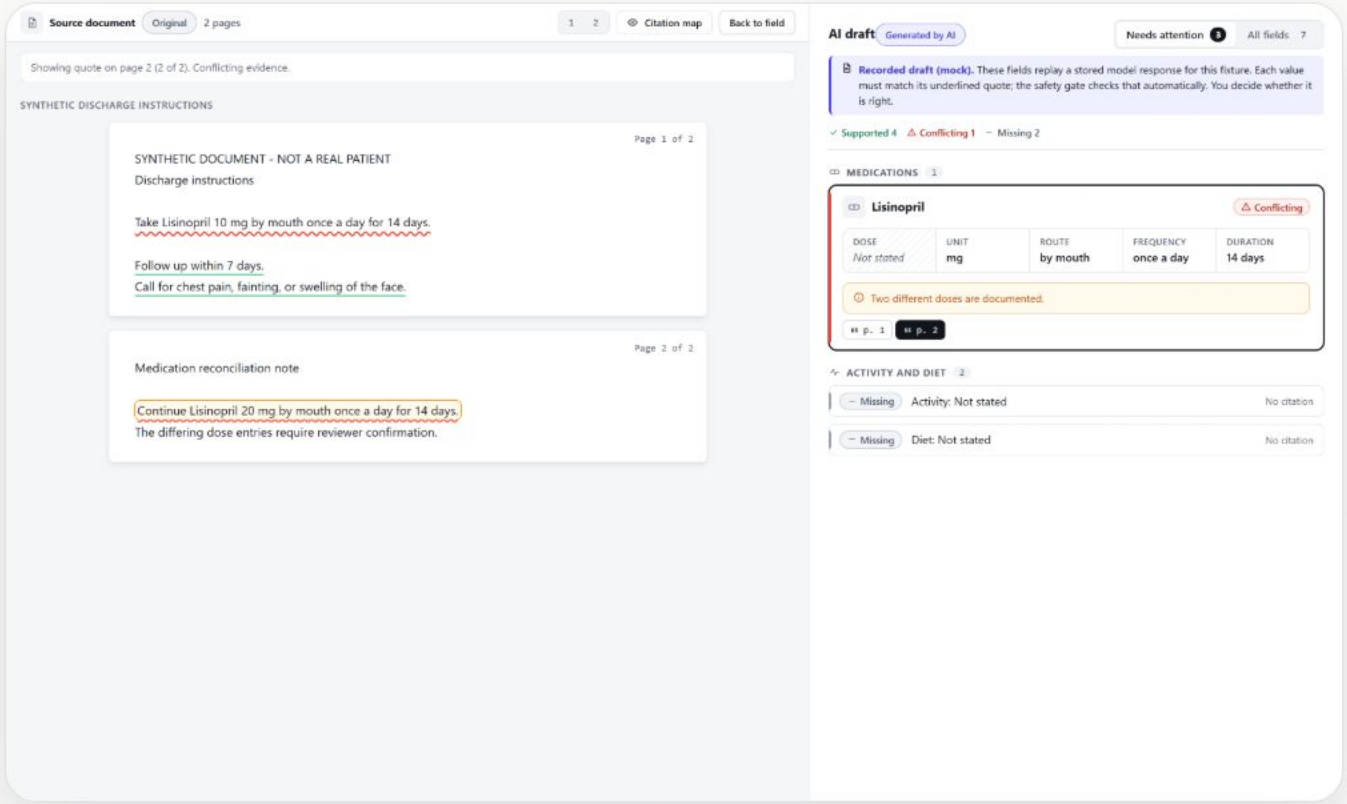

English or Spanish, locked until approval

The source is never modified

The model never sets approval

Any edit or rerun voids an approval

Every value links to its exact quote

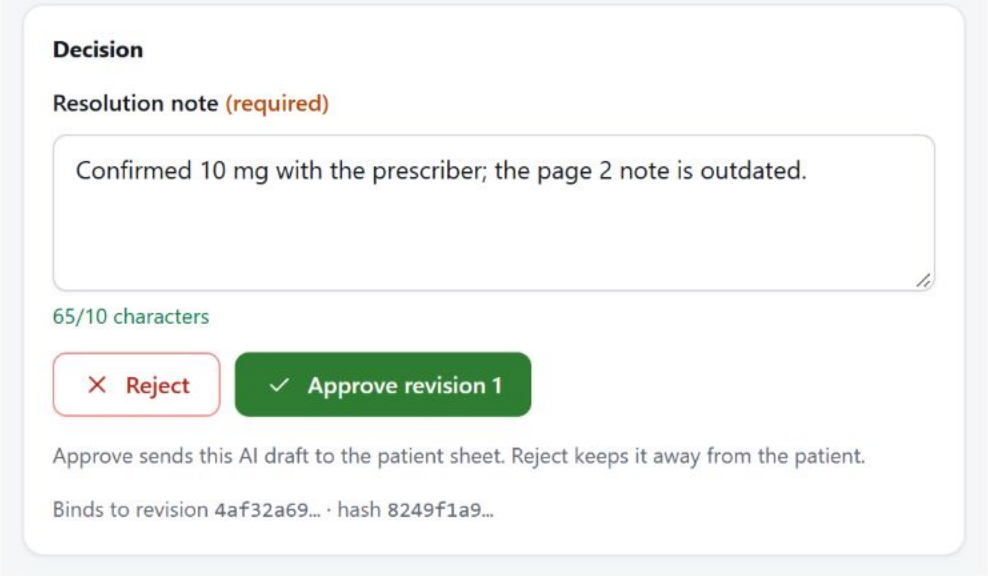

- Select a field or a **p. N** chip: the source scrolls to the quote and highlights it
- Medication values must appear **verbatim** in a verified quote
- Values the document does not state stay **missing**, never guessed

Synthetic document. Screens from the offline demo mode (recorded responses).

A contradiction stops the approval

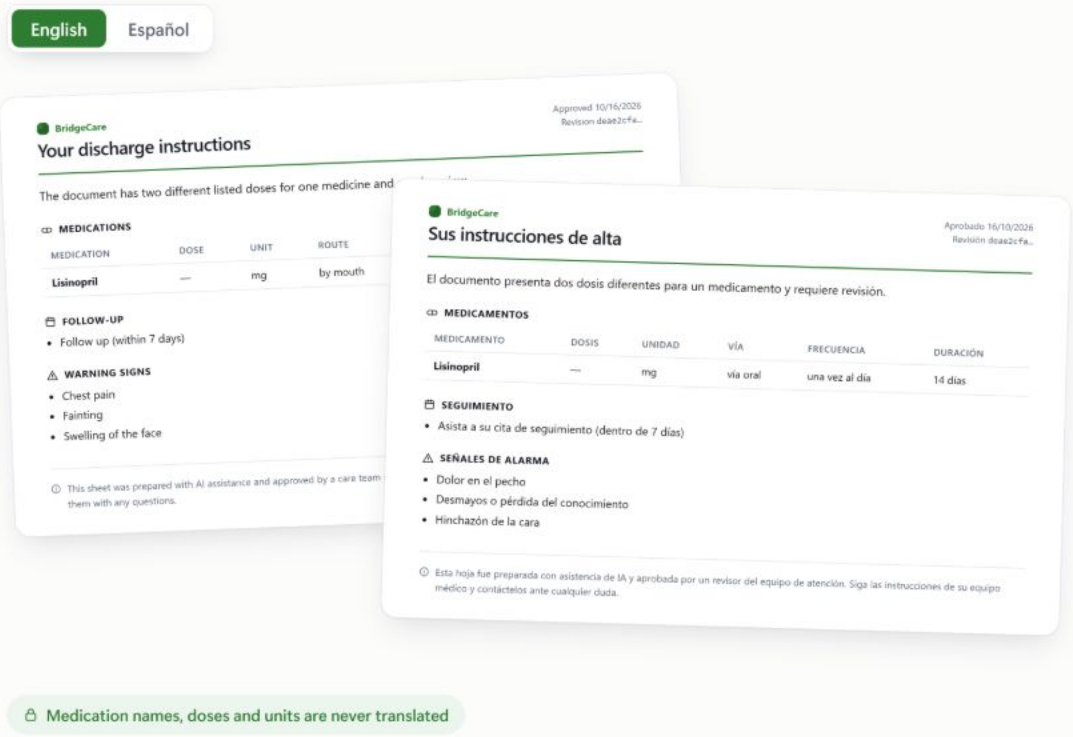

1 **Safety gate.** Two doses for one medicine: approval waits for a written resolution note.

2 **Human decision.** The reviewer approves one exact revision, bound to its content hash.

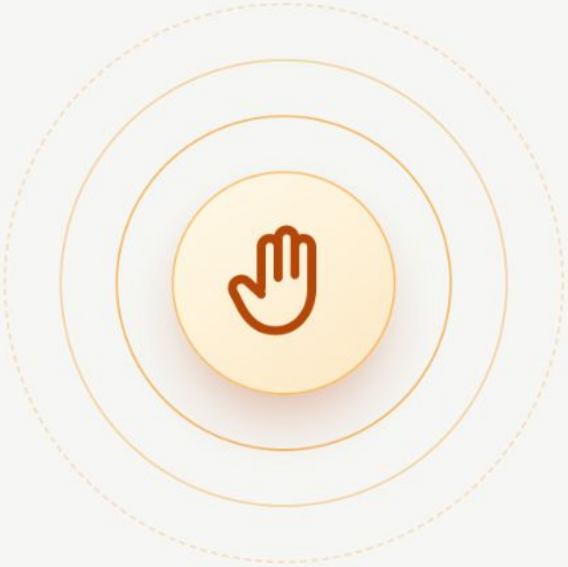

06 · DEMO: THE PATIENT SHEET

One sheet, in English or Spanish

- Built only from **validated fields** and locked until a reviewer approves
- Spanish from a fixed, reviewable glossary; medication names, doses and units stay **untranslated**
- Any phrase it cannot translate is shown in English and flagged **EN**
- Reviewers preview both languages before approving; printing opens after approval

Five controls stop unsafe output

It knows when to stop

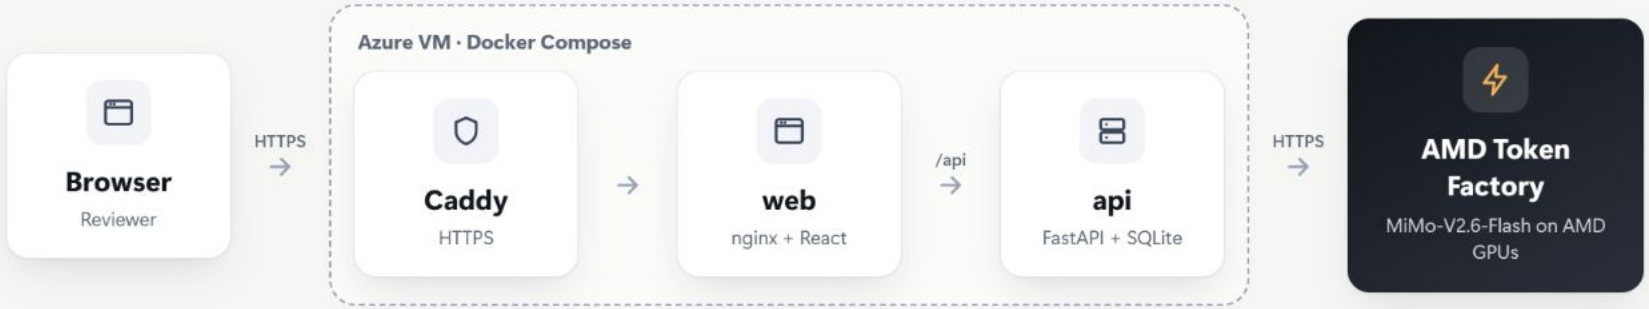

- **Verbatim doses**
  Every medication value must appear word for word in a verified quote
- **Checked citations**
  Each quote is found on the page it cites
- **Resolution note**
  A contradiction needs a written note before approval
- **Model never approves**
  Approval is set only by an authenticated reviewer
- **Hashed revision**
  Approval binds to one exact revision; any edit or rerun invalidates it

Each Track 2 risk has a control

Incorrect outputs	Values must match a verified quote word for word, or approval is blocked
Sensitive data	Synthetic documents only; uploads disabled; documents and drafts are not logged
Uncertain outputs	Values the document does not state are shown as missing, never guessed
High-risk outputs	Contradictions block approval; the sheet uses validated fields only
Human review	Only an authenticated reviewer approves; no diagnosis, treatment or dose calculation

09 · AMD ARCHITECTURE

Real inference on AMD GPUs

Inference

Every extraction runs on AMD Token Factory: MiMo-V2.6-Flash, JSON mode, temperature 0

Evidence in the product

The interface shows the inference host, model, latency and request ID of each call

Hosting

The public demo runs on an Azure VM with an AMD EPYC CPU

10 · RESULTS

Three real runs on AMD

142/144

Medication fields matching the document

15/15

Outcome and gate as expected

0/6

Injected instructions repeated in the output

24/24

Evidence states matching

3/3 runs

Contradictory dose blocked until a resolution note

15.0–17.1 s

Median model latency per run

Three consecutive runs on 2026-10-15 with AMD Token Factory (MiMo-V2.6-Flash, prompt extraction-v4) over five synthetic fixtures. **Small synthetic sample:** it measures extraction fidelity, not clinical correctness.

Source: README, Results (real inference on AMD)

11 · TEAM AND NEXT STEP

Who builds it and where it goes next

J

Jean

Infrastructure, deployment and API core

D

Daniel

Domain API, data contracts and services

F

Felipe

AI model, prompts and evaluation

E

Edgard

Web application and review interface

BUYER

Discharge coordination teams in hospitals and clinics

NEXT

Pilot review with clinical staff

THEN

Measure the time it saves
